# Content integration software

The solution for fragmented content repositories

■ Content is everywhere

Fragmented storage of large amounts of business-critical content is one of the biggest challenges the industry is currently facing. Content is locked in multiple repositories and business applications. Intentions of enterprises trying to store all their content in one single repository has not resulted in better productivity, lower costs or better compliancy. The industry is therefore looking for new solutions that accept the reality that content storage is, was, and will be fragmented.

■ Free your content

Xillio offers one cloud-based developer API, one content model and multiple connectors that connects with all these different repositories. With this, users can access all content within the enterprise from one single application/user interface. For example, they can access M-Files content directly from their SharePoint environment.
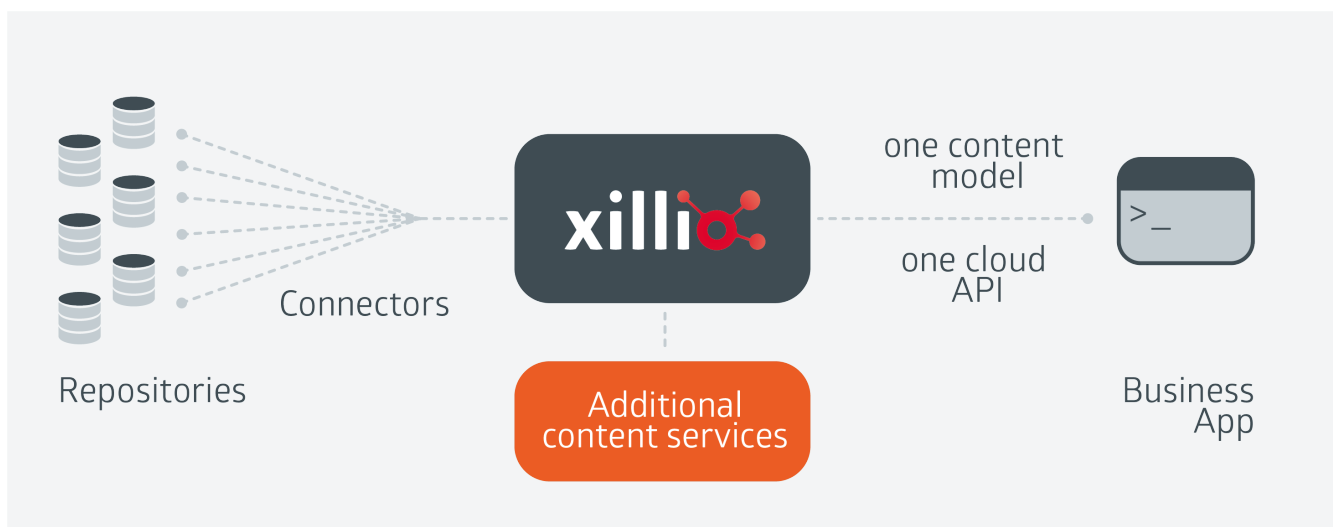

Your situation

- Content is stored in multiple repositories, such as cloud applications, legacy ECM systems, WCM, Collaboration tools, PIM and DAM.
- To integrate these systems is extremely expensive to build and maintain, and error-prone.
- Customers demand a single overview (portal) of all recent information that is available about them.
- Your employees want easy access to all the information they need to do their job.

Our solution

- One cloud API for access to all content systems. This declarative, easy to read API works for all content repositories. It saves you tons of custom development.
- One content model to which all content properties are mapped.
- A large collection of connectors to all common content repositories., such as OpenText, Hadoop, Alfresco, Hippo, SharePoint, FileNet, file shares and many more.
- Additional content services for content enrichment and transformations, such as adding essential content properties.
